Couplings**
for Protection
from Shock,
Misalignment
and Vibration

BIBBY TAPER GRID RESILIENT COUPLINGS

Dr. James Bibby originally invented the Resilient Coupling in 1917 and the 2000 series is the latest development of this well accepted product.

This Bibby Turboflex product has become universally accepted where reliable protection against shaft misalignment, vibration and shock is desirable.

Since those early days refinements in design and material specifications have kept pace with advancing technology, achieving significant improvements in power/weight ratios.

Principles

Positive protection against the damaging effects of shock loads, impact loads and vibration.

The Series 2000 is torsionally flexible. The circumferential flexibility is progressive due to the curved profile of the grooves – ‘state-of-the-art’ in resilient coupling design.

Accommodating Shaft Misalignment and End-Float

The Series 2000 will accommodate combinations of misalignment present at set-up or occurring during machine displacement, settlement, etc.

Limited End-Float kits are available on request.

Set Screw Ø x Length (Cone Point)	Position 'S' from Hub Faces
M5 X 5	2020 = 35 2030 = 40
M6 X 6	2040 = 40 2050 = 45 2060 = 53
M8 X 8	2070 = 54 2080 = 65
M10 X 10	2090 = 72

Recommended Fits Between Shafts and Hubs

Coupling bore tolerances for sizes up to and including 2090T can be specified to suit a transition fit with the shaft. In these instances axial restraint of the hub should be provided by set screws. Relative sizes and positions are given in the table at the left.

For sizes above 2090T or where interference fits are preferred for smaller coupling sizes, bore tolerances should provide an interference fit between shaft and hub of 0.0002 to 0.0007mm per mm of diameter.

Versatile Design

Both 2000H and 2000V couplings feature identical hubs and grid springs, the different cover styles endowing the units with great versatility - one is horizontally split, the other is vertically split.

All coupling components are designed to be interchangeable with other taper grid couplings.

Easy Installation and Maintenance

The grid springs are easily installed by hand or with a soft mallet. The cover fasteners can be tightened with standard wrenches. Every Bibby Turboflex Series 2000 coupling is delivered with detailed installation instructions.

Periodic lubrication of the coupling is required and each cover half is supplied with standard plugs which can be easily removed for re-lubrication. Extended lubrication periods and enhanced coupling life can be achieved by using high performance lubricants referred to in the maintenance instructions.

COUPLING SELECTION PROCEDURE

Table 1 – Service Factors

Complimentary to customers special knowledge of their own equipment

Torque Demands Driven Machine	Typical applications for electric motor or turbine driven equipment	Typical Service Factor
	Constant Torque such as Centrifugal Pumps, Blowers and Compressors	1
	Continuous duty with some torque variations including Extruders, Forced Draft Fans	1.5
	Light shock loads such as Briquetting Machine, Rubber Calendar or Crane and Hoist	2
	Moderate shock loading as expected from a Car Dumper, Ball Mill or Vibrating Screen	2.5
	Heavy shock load with some negative torques from Crushers, Hammer Mill and Barking Drum	3
	Applications like Reciprocating Compressors with frequent torque reversals, which do not necessarily cause reverse rotations	Consult Bibby Turboflex

Table 2

Number of Cylinders	Service Factor
6 and over	0.5 + S.F. Table 1
4 or less	1.0 + S.F. Table 1
Less than 4 refer to Bibby Turboflex	

Information Required

- Type of Prime Mover
- Kilowatt (kW) or Torque Rating
- Rotational speed rpm
- What application the coupling is to be used on
- Type of duty (eg. reversing or unidirectional, frequency of starts and peak torques)
- Diameter of drive and driven shafts
- Any limitation of axial travel
- Any other physical limitations
- Any other specific needs

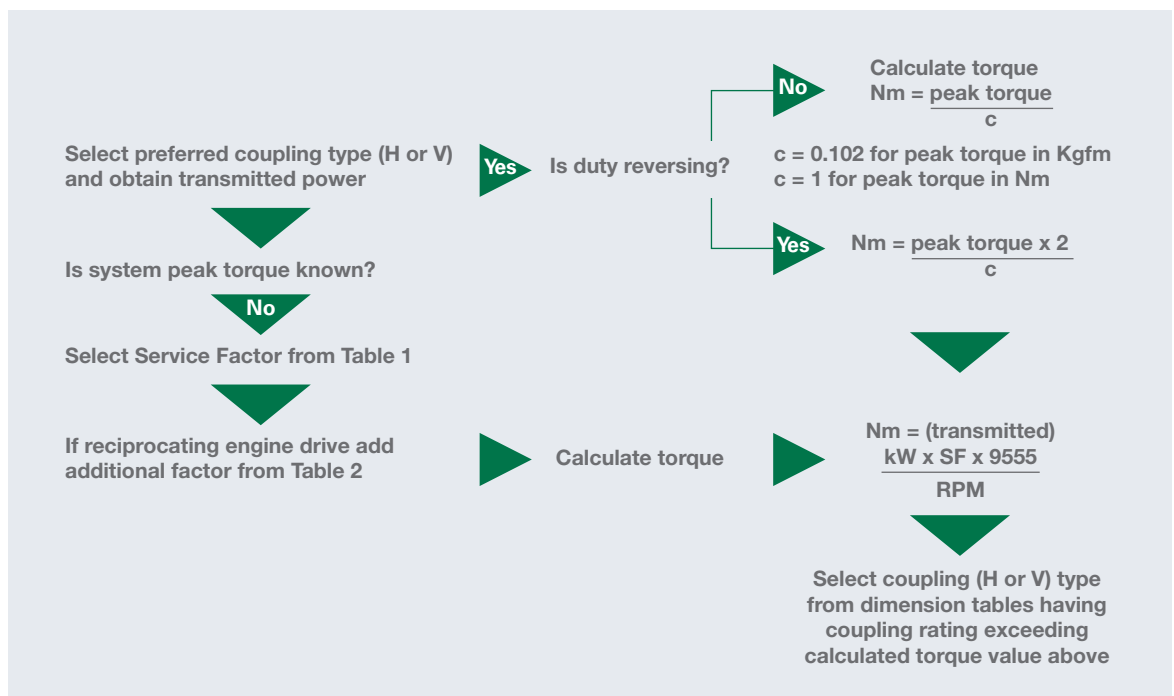

Note: Where high peak loads can occur and for brake applications, please contact Bibby Turboflex at +44(0) 1992 501900 or sales@huco.com

- The system peak torque is the maximum load created by the driving or driven equipment.
- Occasional peak torques of twice the catalog rating can be accommodated providing they occur less than 1000 times during the life of the coupling.
- For drives where the operation is near or actually passes through a major torsional natural frequency, a mass elastic analysis of the system is advised. When the Service Factor in Table 1 is greater than 2, consult your supplier or Bibby Turboflex.

Table 3

Maximum Coupling Bore Sizes		
Duty Class	Load Classification	Max. Bore Size
Uniform	Steady load, soft start, very rarely subjected to maximum loading	Catalog Maximum Bore
Medium	Steady load with superimposed cyclic load fluctuations	$\frac{\text{Boss Diameter}}{1.45}$
Heavy	Repeated maximum load fluctuations/shock loads	$\frac{\text{Boss Diameter}}{1.5}$
Extra Heavy	Regularly subjected to fully reversing maximum loads	$\frac{\text{Boss Diameter}}{1.6}$

Bibby Coupling Selection (If in doubt, please consult your supplier)

Having selected the coupling type and size, now check the following on pages 5 and 6.

- That the coupling running speed is lower than the permitted maximum.
- That the shaft spacing and coupling dimensions can be accommodated.
- That the maximum bore is suitable for the shaft. (If not, go to next size above and check again.)
- Acceptability of key stresses and boss strength for your specific duty. Refer to Table 3.

MODEL 2000H

- Horizontally Split Cover
- General purpose
- Easy access to grid minimizes downtime
- Ideal for limited space applications
- Stop lug in cover prevents spinning during reversing service

① Coupling weight and MR2 with no bore

② Max bores stated above use rectangular parallel keyways to BS 4235 pt 1: 1972 or DIN 6885 sht 1: 1969

Other couplings available are spacer and half spacer models. Also couplings with disc or drum brakes can be supplied.

ATEX Certified
