THE NADELLA COMPANY

THE SPECIALIST FOR MOTION TECHNOLOGY

NADELLA has developed over time from a supplier of rolling bearings, linear guide components and linear axes into an expert system partner for all areas of motion technology. Wherever innovative ideas, precision and reliability are required, developers and design engineers rely on products from NADELLA. Our customers now include renowned mechanical engineering, plant construction and automation engineering companies in Germany, Europe, Asia and the USA.

FULL SERVICE AND JUST IN TIME

We consider ourselves to be a full-service partner – from development of a product through production and all the way to logistics. Our established network guarantees efficient processes in all areas and throughout the value-added chain – all from a single source. Additionally, express deliveries or fast and inexpensive special treatment of catalogue parts is also possible. This also applies to small and medium quantities.

EXPERIENCE AND KNOW-HOW

Professional operations and application consultation are just a few of our distinguishing characteristics: Our consulting engineers collaborate closely with our customers' experts, actively contributing their specialist expertise, their experience and the technical possibilities. This results in custom solutions that set standards.

MAXIMUM QUALITY AND CERTIFIED ENVIRONMENTAL MANAGEMENT

Maximum quality is our top priority. That is why every process step is accompanied and regularly checked by expert employees. All companies and plants are certified according to DIN EN ISO 9001 or ISO/TS 16949, and their environmental management systems comply with DIN EN ISO 14001. We also have the latest measuring and testing equipment at our disposal to ensure that our high quality standards are met over the long term.

- CAQ system
- 3-D CNC measuring machines
- Force testing
- Radiographic inspection
- Microsection analysis
- Materials testing on metal and plastic

WORLDWIDE NETWORK FOR IDEAL SERVICE

MANY PATHS LEAD TO NADELLA – AND THEY ARE SHORT ANYWHERE IN THE WORLD.

Our customers' satisfaction is the basis for our success and growth. That is why we are at your service around the world and always keep your requirements in mind. We now possess a worldwide network of distributors in all important industrialised countries in Europe, Asia and the USA. This allows us to ensure customer-orientated consultation, delivery and service at all times.

TELESCOPIC RAILS

LSS, LST AND LSE

Nadella telescopic rails are ball guided and very compact and flexible products. Made entirely of steel, with profiles cold drawn and raceways induction hardened, enables you to move heavy loads while maintaining excellent rolling features thanks to the robust ball cage interposed between the sliding elements.

The product is composed by the external drawn profile, with C shaped section, the internal slider and the ball-cage:

- Linear guide cold drawn in bearing steel with high durability; internal concave raceways with gothic arch shape, induction hardened for a high wear resistance and durability. The rails are supplied with a standard surface treatment of white zinc plating.
- Internal slider in bearing steel with high durability; internal concave raceways with gothic arch shape, induction hardened for a high wear resistance and durability. Sliders are supplied drilled with a surface treatment of electrolytic white zinc plating.
- Bent steel plate ball-cage with surface treatment of white zinc plating which holds the rolling elements consisting of steel bearing balls, which allows the reciprocal sliding of the elements; the high diameter and the narrow pitch between the balls allow a very high load capacity.

The raceways have a gothic arch shape which increases the load capacity of the system compared with the v shaped raceways.

The proposed range includes three lines:

- Semi-telescopic rails LST, where the slider can escape for more than half its length.
- Telescopic rails LSE, that allow a stroke equal to the length of the closed rail, thanks to the intermediate element that acts as a bridge between the two sliders.

- LSS rails, with one or more sliders which run inside the rail.

Our rails are available in two sizes, 28 and 43, and can be supplied in the standard version according to the present catalogue, or in several different configurations according to the requiring of the applications.

SURFACE TREATMENT

LSS and LST rails are supplied with a surface treatment of electrolytic white zinc plating on all the components (slider, rail and ball-cage). Zinc-plating treatment process is done after drilling the elements.

On request other surface treatments can be supplied (chemical nickel plating, suffix NW, phosphating).

Balls, in bearing steel, hardened, don't have any surface treatment. Upon request the rails can be equipped with balls in stainless steel.

LUBRICATION

For a proper exercise and to ensure an adequate lifetime, a film of lubricant must always be guaranteed in the contact area between the balls and the raceways of the elements (relubricate the raceways periodically according to the own specific working cycle and the environment, in order to always guarantee a layer of lubricant in the contact area between balls and raceways). The guides are provided with raceways lubricated with a bearing grease with a base of soap barium, which allows to work in a temperature range between -20°C and $+120^{\circ}\text{C}$. Please contact our technical support if you plan application with higher temperatures.

We recommend the lubrication of the raceways at least every 50 000 cycles.

For extreme working temperature, please contact our Technical service.

TELESCOPIC RAILS

LSS, LST AND LSE

LUBRICATION AND TEMPERATURE

We recommend to use the rails with lubrication on the raceways. During production the rails are equipped with a lubricant which allows to work in a range of temperatures between -20°C and $+120^{\circ}\text{C}$. Out of this range suitable mounting precautions should be evaluated: use of a lubricant for extreme temperatures, mounting with increased clearance, to remedy to the thermal expansion.

Maximum working temperature is 170°C , for higher temperature the use should happen in consideration of a reduction of the load capacity (at high temperatures the hardened raceways undergo a tempering process, reducing the surface hardness of the elements).

MAXIMUM SPEED

We suggest to work at speed not higher than 0.5 m/s in order to have a correct functioning (for rails LSE maximum speed $0,3\text{ m/s}$).

These products are suggested for applications with small inversion frequencies and accelerations (please consult the following «Suggestions for a correct mounting» paragraph).

LOAD CAPACITIES

Guide rails with ball cage have preferential load capacity with the mounting on the side (major axis).

Ideal mounting configuration is realised with two parallel guide rails, with the load to be moved uniformly distributed on the moving elements. Mounting of the guide rail to the structure and of the external load to the sliders should involve all available holes of the components.

Load capacities are expressed in N (Newton), torque load capacities are expressed in Nm, refer to the Cartesian axes with origin in the centre of the slider and are valued according to standard ISO 14728-2. Tables of load capacities in the following pages refer to a single slider and are to be intended as maximum static admissible loads for a smooth operation.

In order to choose the correct guide rail we suggest to use the product with the appropriate load capacity by calculating the safety factor F_s . With more loads and torques acting simultaneously in different directions the check of the loads shouldn't be on the single component, but the contemporary action of all the components should be considered (P_{eq}).

$$F_s = \left(\frac{C_y}{P_{eq}} \right) > 1$$

$$P_{eq} = P_1 + \left(\frac{P_2}{C_z} + \frac{M_1}{M_x} + \frac{M_2}{M_y} + \frac{M_3}{M_z} \right) \times C_y$$

with:

- P_{eq}** equivalent load in Y direction resulting from the combination of all the loads and torques acting contemporary on the slider
- P₁** load applied in the middle of the slider in Y direction
- P₂** load applied in the middle of the slider in Z direction
- M₁** torque applied in the middle of the slider around X axis
- M₂** torque applied in the middle of the slider around Y axis
- M₃** torque applied in the middle of the slider around Z axis
- C_y** maximum admissible static load capacity in Y direction
- C_z** maximum admissible static load capacity in Z direction
- M_x** maximum admissible static torque load capacity around X axis
- M_y** maximum admissible static torque load capacity around Y axis
- M_z** maximum admissible static torque load capacity around Z axis

TELESCOPIC RAILS

LSS, LST AND LSE

LIFETIME

Lifetime of the guide rail is the maximum stroke (in km for rails LSS) or maximum number of cycles (for rails LST and LSE), that the guide rail will be able to reach before the appearances of plastic deformation on the raceways.

For rails LSS

$$L_{\text{km}} = 100 \times \left(\frac{C_{100}}{P_{\text{eq}}} \times \frac{1}{f} \right)^3$$

For rails LST and LSE

$$L_{\text{cycles}} = 100000 \times \left(\frac{C_{\text{dyn}}}{P_{\text{eq}}} \times \frac{1}{f} \right)^3$$

with:

C₁₀₀ dynamic load in Y direction [N], valued according to standard ISO 14728-1 for the calculation of the lifetime in km (rails LSS)

C_{dyn} dynamic load in Y direction [N], valued according to standard ISO 14728-1 for calculation of the lifetime in cycles (rails LST and LSE)

P_{eq} equivalent load in Y direction resulting from the combination of all the loads and torques acting contemporary on the slider (see formula above)

f application coefficient

Smooth operation at low speed at constant load without shocks

..... **f = 1 - 1.2**

Smooth operation with load variation

..... **f = 1.2 - 1.5**

Operation with small shocks and vibrations

..... **f = 1.5 - 2**

High accelerations, shocks and vibrations

..... **f = 2 - 4**

DEFLECTION

The deflection is the elastic deformation you can register at the edge of the opened rail when a load is applied.

With semi-telescopic rails LST, that can partially exit from the rail, the deflection will depend almost exclusively on the rigidity of the structures connected to the guide elements.

For telescopic rails LSE, please refer to the values of deflection written in the tables of the load capacities and which refer to the maximum load (Cy) applied in the middle of the opened slider. For applied loads inferior to the maximum load capacity, please reduce the deflection proportionally.

SUGGESTIONS FOR A CORRECT MOUNTING

In guide systems based on ball-cage, the sliding occurs thanks to the simultaneous movement of the slider and of the ball-cage: the slider, moved by a drive system or manually, sets in motion the ball-cage, which will cover half of the stroke done by the slider, until reaching the end-stop.

During operation, with the succession of working cycles and consequent motion reversals, imperceptible displacements of the ball-cage, in relation to the position of the slider, occur, due to the inertia to the movement of the ball-cage that doesn't engage immediately when the slider starts its race.

This process, that is defined displacement and leads to a gradual reduction of the stroke and consequent dragging of the ball-cage on the raceways, can be slowed down by a correct use, with races constantly up to the end stops and low speed and acceleration. The restoration of the proper functioning must be done by setting a forced cycle up to the end stop: when the movement of the slider is commanded by a drive system, we recommend to provide a peak motor torque 10 times higher (friction coefficient in normal condition is 0,01).

Guide systems based on ball-cages are recommended for movement on the horizontal plane. Movement in the vertical direction is not recommended because the ball-cage tends to fall by gravity, accelerating the process of displacement.

Providing an external end stop is highly recommended in order not to discharge on the screw of the internal stop the arrest of the machine.

TELESCOPIC RAILS

LSS, LST AND LSE

During the mounting of LSS and LST rails we suggest to work the holes in the support in order to avoid any interference between the screws and the sliders (see table below).

Size	Chamfer
LSS28, LST28	1 x 45°
LSS43, LST43	1.5 x 45°

EXTERNAL END STOPS

Provide external end stop in order not to discharge on the screws of the internal stop the arrest of the machine.

Mounting screws of resistance class 10.9 are recommended for mounting.

FRICTION COEFFICIENT

The friction coefficient in normal condition is equal to 0,01.

When the movement of the slider is commanded by a drive system, we recommend to provide a peak motor torque 10 times higher than the standard required due to the process of displacement (see the "Suggestion for a correct mounting" paragraph).

For telescopic rails LSE the force necessary for closing the rails and let the slider go back in central position is increased from the deflection due to the extraction of the moving elements.

NOTES

A large grid of graph paper for taking notes, consisting of 20 columns and 30 rows of small squares.

PART EXTENSIONS

LST

LST 28

LST 43

Part extensions LST of Nadella allow the partial extraction of the slider which escapes for more than half its length from the edge of the rail, while maintaining a smooth and regular movement through the interposition of a robust metal ball-cage. The perfect solution for all applications requiring a protruding extraction.

LST guide rail is available in two sizes, LST28 and LST43, and several standard lengths (on request different rail lengths can be provided that will be managed as special items).

LOAD CAPACITIES

Part extensions with ball cage have preferential load capacity with the mounting on the side (major axis).

Ideal mounting configuration is realised with two parallel guide rails, with the load to be moved uniformly distributed on the moving elements. Mounting of the guide rail to the structure and of the external load to the sliders should involve all available holes of the components.

Ideal mounting configuration with two parallel LST, load in preferential direction applied in the middle of the sliders.

DOUBLE STROKE

In order to obtain the double stroke and allow the slider to escape in both directions, please remove the screw at the edge of the rail.

Remove the screw at the edge of the rail for double stroke.

DOUBLE STROKE

In order to obtain the double stroke and allow the slider to escape in both directions, please remove the screw at the edge of the rail.

FULL EXTENSIONS

LSE

LSE 28

LSE 43

Full extensions LSE allow a stroke equal to the length of the closed rail, thanks to the intermediate element that acts as a bridge between the two sliders.

LSE guides allow a smooth and regular movement and are the perfect solution for all the applications requiring a total telescopic extraction.

LSE guide rail is available in two sizes, LSE28 and LSE43, and several standard lengths (on request different rail lengths can be provided that will be managed as special items).

LOAD CAPACITIES

Full extensions with ball cage have preferential load capacity with the mounting on the side (major axis). Ideal mounting configuration is realised with two parallel guide rails, with the load to be moved uniformly distributed on the moving elements. Mounting of the guide rail to the structure and of the external load to the sliders should involve all available holes of the components.

AVAILABLE HOLE CONFIGURATIONS

LSE full extensions are available with countersunk holes (suffix V) and threaded holes (suffix F), or in the mixed version (suffix M), with one slider with countersunk holes and one slider with threaded holes.

LSE28-...V
LSE43-...V

Code example: LSE28-450 V, full extension LSE size 28, closed length 450 mm, countersunk holes in both sliders

LSE28-...F
LSE43-...F

Code example: LSE43-770 F, full extension LSE size 43, closed length 770 mm, threaded holes in both sliders.

LSE28-...M
LSE43-...M

Code example: LSE43-1170 M, full extension LSE size 43, closed length 1170 mm, threaded holes on one slider and countersunk holes in the opposite one.

DOUBLE STROKE

In order to obtain the double stroke and allow the slider to escape in both directions, please remove the screw at the edge of the intermediate element.

Remove the screw at the edge of the rail for double stroke.

Ideal mounting configuration with two parallel LSE, load in preferential direction applied in the middle of the sliders.

LINEAR GUIDES

LSS

LSS 28

LSS 43

With LSS linear guides the movement is achieved through one or more sliders which run inside the guide rail. Several different combinations are possible and the final product can be configured out according to the application requests.

LSS WITH SINGLE SLIDER

In the standard configuration the final product is composed by the guide rail inside which run a single ball-cage and a single slider.

LSS28-total length L-stroke

LSS WITH TWO INDEPENDENT SLIDERS

This configuration allows the movement, inside the guide rail, of two ball-cages, inside each ball-cage one or more sliders. The two ball-cages can run in opposing directions.

LSS43-total length L-2xstroke

LSS WITH TWO SYNCHRONISED SLIDERS

This configuration allows the movement inside the ball-cage of two synchronized sliders.

LSS43-total length L-stroke-2xlength of the slider

TECHNICAL INFORMATION

NADELLA TELESCOPIC SYSTEMS

Nadella telescopic slides are special ball bearing guides for high load rating. Two or more ball bearing mounted guide rails which can be drawn telescopic-wise guarantee a high reliability. According to the requirements a combination of different manufactured parts is used (rolled parts, cold-rolled steel and machined parts). Load and extension proportions are the basic characteristics of the telescopic slides. The model line is made up of five types and three extension proportions.

PART EXTENSIONS

extension length 50-70% of the assembly length

FULL EXTENSIONS

extension length 100% of the assembly length

FULL EXTENSIONS IN Z DESIGN

extension length 100% of the assembly length

HEAVY DUTY EXTENSIONS

extension length 100% of the assembly length

OVER EXTENSIONS

Extension length ca. 150 – 200% of the assembly length

From these types numerous variations are derived in order to offer the ideal telescopic slide regards extension length, load magnitude and assembly. Further functions as forward / backward extension, special end stop dampers and lockings can supplementary be delivered.

Nadella aims to offer customized solutions with this product in a machine building quality. Telescopic slides are robust and need little maintenance for a long life. Economical solutions can be realized due to low supply costs and a simple assembly.

Nadella slides are linear guides with one or more carriages with re-circulation linear ball bearings running on a rail. Telescopic slides and guides are based on the same linear rails and can be combined with each other.

APPLICATIONS FOR NADELLA TELESCOPIC SLIDES

Nadella telescopic slides are used in many different areas, e.g. in the machine building, railcars, special vehicles for example in rescue vehicles, ship building or military vehicles, conveyor and storage techniques and many others. Telescopic slides are often used for battery boxes, handling and door systems, protection covers, switch cabinets, cashpoint (ATM) and other.

ASSEMBLY

An outer rail and one or more inner rails are the basic elements of the telescopic slides. As rolling element hardened balls are used which are kept in cages. With special chosen balls nearly zeroplay will be reached. A defined play for special enviromental conditions e.g. for high-temperature can be agreed. Standard end stops avoid an unintentional cutting of the different slide parts. All threads and fixing holes are easily accessible for assembly.

The standard mounting and extension lengths of each telescopic slide is shown in the dimension sheets. The standard lengths of many mounting sizes are divided into 50 and 100 mm steps. Special mounting lengths or special extensions can be provided upon customer's demand.

TECHNICAL INFORMATION

STANDARD LENGTHS' TOLERANCES

Installation length (mm)	≥ 150 < 420	≥ 420 < 1050	≥ 1050 < 2840
Tolerance (mm)	± 0,5	± 0,8	± 1,2

STEEL, STAINLESS STEEL (NX) AND ALUMINIUM (A)

Nadella telescopic rails are made of coil material or machined and drawn steel profiles. According to size and allowed load the most economic manufacturing process is used. All linear guides are surface coated and therefore effectively protected against corrosion. Alternatively, many telescopic slides can also be produced of stainless steel (NX variation) or aluminium (A).

STANDARD MATERIALS

The guides made of stainless steel (NX) have reduced basic load ratings (about 70%). The guides made of aluminium have a reduced weight and reach a basic load of about 30-40%.

	Guide rail	Cage	Ball
Standard	C45 (1.0503)	Steel coated	100Cr6 (1.3505)
Stainless steel (NX2/NX4)	NX2 load capacity -30% (1.4301) NX4 load capacity -40% (1.4571)	Stainless steel	X46Cr13 (1.4034)
Aluminium (A)	3.3206 EV1 -70%	Stainless steel	X46Cr13 (1.4034)

CORROSION PROTECTION THROUGH SURFACE TREATMENT

All Nadella telescopic slides are surface treated and are effectively protected against corrosion for many applications. Depending on demand, application case and surrounding condition different surface treatments are possible or stainless steel version (NX) is available. The resistance of the surface treatments varies from 240 up to more than 700 hrs.

As standard NC1 we offer the telescopic slides with free zinc coating (Fe/Zn8/Top-Coat) with thick-layer passivation acc. to RoHS. The surface is silver shining with a slight blue gleam.

Shortcut	Coating	RoHS	Salt bath spraytest
NC1	Zinc-thick layer passivation	yes	about 240 hrs.
NC4	Zinc nickel plated with passivation	yes	over 700 hrs.

ADDITIONAL FUNCTIONS AND SPECIAL EQUIPMENTS

FORWARD AND BACKWARD EXTENSION (VR, VRM)

Many systems of the part and full extensions can be delivered as forward and backward extension.

The inner rails of full extensions in 3 parts can be controllably shifted through carriers (VRM). The advantage is a higher security because the unintentional moving of the middle rail of the backward extension can be prevented. The loads at the end of a telescopic slide can be better adopted with an optimum distribution of the rails.

END STOPS AND DAMPERS (EDG, FDOG)

End stops are standardized equipment for all telescopic slides. Furthermore special dampers can be provided for numerous extensions. There is the possibility to choose between simple cheap plastic or elastomer dampers – fixed directly at the end – or special spring dampers.

CATCHES (EHG, EHO, EOG) OR LOCKINGS (VO, VG, VOG)

Lockings are strong fixings via spring pieces which guarantee that a self movement of the extensions can effectively be prevented.

Catches are form fit fixing devices which fix the extensions with bolts or spring locks in their end positions. Without opening the spring lock none of the slides can move. This application is chosen for person and material safety reasons.

LOCKING

LOCKING PIN

VRM CARRIER

TECHNICAL INFORMATION

READY MADE COMPLETE SOLUTIONS

For special applications ready for installation complete solutions can be realized taking into account the economic lot size. These systems can be built out of telescopic rails with customized frame, end dampers, end stops or lockings and more.

CHOICE AND VARIATIONS OF TELESCOPIC SLIDES

Nadella telescopic slides are preferential made for static applications with lower dynamic. They are ideal because of their unhardened tracks and the robust and rigid body for high loads which must be moved from time to time, but they are also ideal for constant movements with lower dynamic.

GENERAL BASIC CONDITIONS:

- Pair wise operation
- Vertical installation position
- Center of gravity of load in the middle between telescopic slide pairs
- Center of gravity of load in the middle of the rail drawers
- Permissible loads can only be reached when using all standard fixing points

Standard application: Drawer extension telescopic rails vertical.

With horizontally installed telescopic rails up to 50 % of the allowed loads can be used depending on the type of rail. Besides the deflection will be significantly higher. Therefore a horizontally installation is recommended for a limited extend only when using small rails or extensions more than 600 mm.

If this is the case, please contact Nadella's technical service for additional information.

SPRING DEFLECTION

Spring deflection means the deflection of the full telescopic guide under maximum load. Telescopic rails which are correctly installed and with equally divided load between the extension pairs only have a very low deflection because of their rigid body. The standard telescopic rails have a spring deflection of approx. 1 % with the maximum use of the load, pair wise use and radial load (vertically mounted). For any application with tangential load or horizontal installations, please contact Nadella's technical service.

DYNAMIC AND LIFETIME

Telescopic rails are mainly aimed for static applications. The average speed with greased tracks are said to be up to 0,5 m/sec.

Higher speed or continuous operation or more than 10 strokes/min will negatively influence the lifetime. If higher dynamics are required you should use a bigger oversized guide rail and a reduced lubrication interval. You have also the possibility to use telescopic rails with nitrided surface. The standard operation temperature is between +10°C and +80°C, but depending on the application, the temperature range can be higher up to 300°C. In this case, adaptations must be made regards bearing air and eventually surface coating and special high temperature lubricants are necessary.

INSTALLATION OF TELESCOPIC RAILS

The telescopic rails with nearly zero play must be mounted parallel and angled for a perfect operation. All fixing holes and/or threads should be used for an optimum use of load.

Screws only with a strength grade of at least 8.8 should be used for assembly and to be fixed according to the screw producer's guidelines. Under certain circumstances the guide rails can be equipped with increased bearing air and can be mounted with a slight stroke.

TECHNICAL INFORMATION

MAINTENANCE AND LUBRICATION

All Nadella telescopic slides and guide rails are extremely maintenance free. Standard rails are delivered fully installed and greased. Rails made of stainless steel or aluminium will be delivered ungreased.

Depending on the surrounding conditions they should be checked from time to time, dirt should be removed and “dry” rails should be regreased. This prevents friction, protects the assembly parts and provides a long life. The regreasing term is variable and should be calculated regards use conditions such as load, travel conditions, temperature, dirt etc..

The ball cages of the telescopic slides are not restraint-guided, consequently the cage can move. In this case the end positions have to be reset.

NOTES

APPLICATION EXAMPLE

Application	Protective equipment
Industry	Rubber- and plastics machines Machinetools
Products	Full-extension (NTV)

8.2

APPLICATION EXAMPLE

Application	Product supply
Industry	Medical technology, semi-conductor technology, etc.
Products	Full-extension (NTV)

Application	Component magazine
Industry	Warehouse and logistics.
Products	Full-extension (NTV)

APPLICATION EXAMPLE

Application	Battery move-out / Door rail guide
Industry	Railway technology
Products	Full Extension Z-Steel Basic Profile (NTVZ)

INSTALLATION LENGTH

OPTIONS

AI = Aluminum
SB = Standard hole pattern (not required)
NZ = Design acc. drawing (e.g: customised hole pattern)
KK = Balls and cage stainless steel (standard for NX- and A-rails)
NC1 = Zinc-thick layer passivation (standard)
NC4 = Zinc-nickel plated
NC5 = Standard steel without coating
NX2 = Stainless Steel Rail A2 Mat. 1.4301 (Load - 30%)
NX4 = Stainless Steel Rail A4 Mat. 1.4571 (Load - 40%)
EHG = Catch retracted rail
EHO = Catch extended rail
EOG = Catch double sided
VG = Locking retracted rail
VO = Locking extended rail
VOG = Locking open and closed
EDG = Damper, closed
FDOG = Spring damper, open + closed
VR = Forward and backward extension
VRM = Forward and backward extension including carrier for inner rail
AZ = Special extension length (not necessary for standard version) Example: NTV48-22T-1000-AZ1080 = Extension length 1080 mm
LL = Smooth-running, for temperature up to 200°C or vertical installation
LS = Increasing clearance, for temperature > 200°C
G = Hardened
